

An introduction to Head-Driven Phrase Structure Grammar and remarks on its position in the theoretical landscape

Stefan Müller

Institut für Deutsche und Niederländische Philologie
Fachbereich Philosophie und Geisteswissenschaften
FU Berlin

Stefan.Mueller@fu-berlin.de

FU Berlin, 21.11.2012

Outline

- Grundlegendes zur HPSG
- Valenz und Grammatikregeln
- Die Modellierung von Konsumentenstruktur mit Hilfe von Merkmalstrukturen
- Projektion von Kopfeigenschaften
- Trennung zwischen Syntax und Semantik: Koordination
- Satzstruktur
- Zusammenfassung

Head-Driven Phrase Structure Grammar (Background)

- developed in the 80s as a successor of GPSG (influences from CG, GB, CxG)

Head-Driven Phrase Structure Grammar (Background)

- developed in the 80s as a successor of GPSG (influences from CG, GB, CxG)
- main publications Pollard and Sag, 1987, 1994, many contributions since then
 - syntactic theory
 - language typology
 - computational linguistics, grammar development
(German, English, French, Norwegian, Japanese, Spanish, Persian, Maltese, Danish, Polish, Mandarin Chinese, . . .)

Head-Driven Phrase Structure Grammar (Background)

- developed in the 80s as a successor of GPSG (influences from CG, GB, CxG)
- main publications Pollard and Sag, 1987, 1994, many contributions since then
 - syntactic theory
 - language typology
 - computational linguistics, grammar development
(German, English, French, Norwegian, Japanese, Spanish, Persian, Maltese, Danish, Polish, Mandarin Chinese, . . .)
- Phonology, morphology, syntax, semantics, and pragmatics (information structure) are covered.

Head-Driven Phrase Structure Grammar (Background)

Labeled Boxes

Those who moved to a new flat will agree that it makes sense to label boxes.

We have information about the most important element in each box.

Boxes May Be Replaced by Boxes with the Same Label

- The content of the box do not matter:
 - (1) a. he
 - b. the man
 - c. the man from Stuttgart
 - d. the man from Stuttgart that we know

Important: the words and phrases in (1) are nominal and complete: NP
We can exchange them for each other in bigger boxes that contain an NP.

Boxes May Be Replaced by Boxes with the Same Label

- The content of the box do not matter:
 - (1) a. he
b. the man
c. the man from Stuttgart
d. the man from Stuttgart that we know

Important: the words and phrases in (1) are nominal and complete: NP
We can exchange them for each other in bigger boxes that contain an NP.

- This does not work for all NPs:
 - (2) a. The man read a paper.
b. *The men reads a paper.
c. *Him reads a paper.
- Certain properties are important for the distribution of phrases.

Boxes with Detailed Labels

All features that are relevant for the distribution of a phrase are projected.

These features are called **head features**.

Basic Assumptions

- lexicalized (head-driven)

Basic Assumptions

- lexicalized (head-driven)
- sign-based (Saussure, 1916)

Basic Assumptions

- lexicalized (head-driven)
- sign-based (Saussure, 1916)
- typed feature structures (lexical items, phrases, principles)

Basic Assumptions

- lexicalized (head-driven)
- sign-based (Saussure, 1916)
- typed feature structures (lexical items, phrases, principles)
- multiple inheritance

Basic Assumptions

- lexicalized (head-driven)
- sign-based (Saussure, 1916)
- typed feature structures (lexical items, phrases, principles)
- multiple inheritance
- monostratal theory

- Phonology
- Syntax
- Semantics

Basic Assumptions

- lexicalized (head-driven)
- sign-based (Saussure, 1916)
- typed feature structures (lexical items, phrases, principles)
- multiple inheritance
- monostratal theory

- Phonology
- Syntax
- Semantics

Basic Assumptions

- lexicalized (head-driven)
- sign-based (Saussure, 1916)
- typed feature structures (lexical items, phrases, principles)
- multiple inheritance
- monostratal theory

- Phonology
- Syntax
- Semantics

Basic Assumptions

- lexicalized (head-driven)
- sign-based (Saussure, 1916)
- typed feature structures (lexical items, phrases, principles)
- multiple inheritance
- monostratal theory

- Phonology
- Syntax
- Semantics

Valence and Grammar Rules

- Arguments are represented as complex categories in the lexical representation of the head (as in Categorical Grammar)

Valence and Grammar Rules

- Arguments are represented as complex categories in the lexical representation of the head (as in Categorical Grammar)
- Verb SUBCAT
 - schlafen* ('sleep') ⟨ NP ⟩
 - lieben* ('love') ⟨ NP, NP ⟩
 - sprechen* ('talk') ⟨ NP, PP[über] ⟩
 - geben* ('give') ⟨ NP, NP, NP ⟩
 - dienen* ('serve') ⟨ NP, NP, PP[mit] ⟩

Example Structure with Valency Information (I)

V[SUBCAT < >] corresponds to a complete phrase (VP or S)

Example Structure with Valency Information (II)

Valence and Grammar Rules

- specific rules for head-argument combinations:

$$V[\text{SUBCAT } \boxed{A}] \rightarrow \boxed{B} \quad V[\text{SUBCAT } \boxed{A} \oplus \langle \boxed{B} \rangle]$$

Valence and Grammar Rules

- specific rules for head-argument combinations:

$$V[\text{SUBCAT } \boxed{A}] \rightarrow \boxed{B} \quad V[\text{SUBCAT } \boxed{A} \oplus \langle \boxed{B} \rangle]$$

- \oplus is a relation that combines two lists:

$$\langle a, b \rangle = \langle a \rangle \oplus \langle b \rangle \text{ oder}$$

$$\langle \rangle \oplus \langle a, b \rangle \text{ oder}$$

$$\langle a, b \rangle \oplus \langle \rangle$$

Valence and Grammar Rules

- specific rules for head-argument combinations:

$$V[\text{SUBCAT } \boxed{A}] \rightarrow \boxed{B} \quad V[\text{SUBCAT } \boxed{A} \oplus \langle \boxed{B} \rangle]$$

- \oplus is a relation that combines two lists:

$$\langle a, b \rangle = \langle a \rangle \oplus \langle b \rangle \text{ oder}$$

$$\langle \rangle \oplus \langle a, b \rangle \text{ oder}$$

$$\langle a, b \rangle \oplus \langle \rangle$$

- generalized, abstract schema (H = head):

$$H[\text{SUBCAT } \boxed{A}] \rightarrow H[\text{SUBCAT } \boxed{A} \oplus \langle \boxed{B} \rangle] \quad \boxed{B}$$

Representation of Valence Information in Feature Descriptions

gibt (finite form):

PHON	⟨ <i>gibt</i> ⟩
PART-OF-SPEECH	<i>verb</i>
SUBCAT	⟨ NP[<i>nom</i>], NP[<i>acc</i>], NP[<i>dat</i>] ⟩

NP[*nom*], NP[*acc*] and NP[*dat*] are abbreviations of complex feature descriptions.

Representation of Grammar Rules (I)

- Feature descriptions are the description inventory for
 - morphological rules
 - lexical entries and lexical rules
 - syntactic rules

Representation of Grammar Rules (I)

- Feature descriptions are the description inventory for
 - morphological rules
 - lexical entries and lexical rules
 - syntactic rules
- Separation of immediate dominance (ID) and linear precedence (LP)

Representation of Grammar Rules (I)

- Feature descriptions are the description inventory for
 - morphological rules
 - lexical entries and lexical rules
 - syntactic rules
- Separation of immediate dominance (ID) and linear precedence (LP)
- Dominance is encoded in `DTR` features (head daughter and non-head daughters)

Representation of Grammar Rules (I)

- Feature descriptions are the description inventory for
 - morphological rules
 - lexical entries and lexical rules
 - syntactic rules
- Separation of immediate dominance (ID) and linear precedence (LP)
- Dominance is encoded in `DTR` features (head daughter and non-head daughters)
- precedence is implicit in `PHON`

Partial Structure in Feature Representation

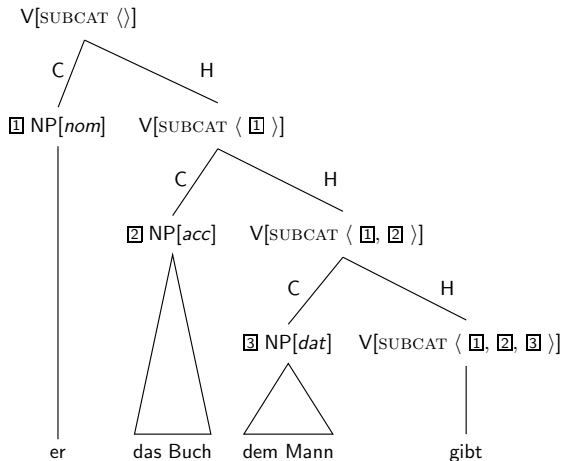

- There is exactly one head daughter (HEAD-DTR).
 The head daughter contains the head.
 Structure with the daughters *the* and *picture of Mary* →
picture of Mary is the head daughter, since *picture* is the head.

Partial Structure in Feature Representation

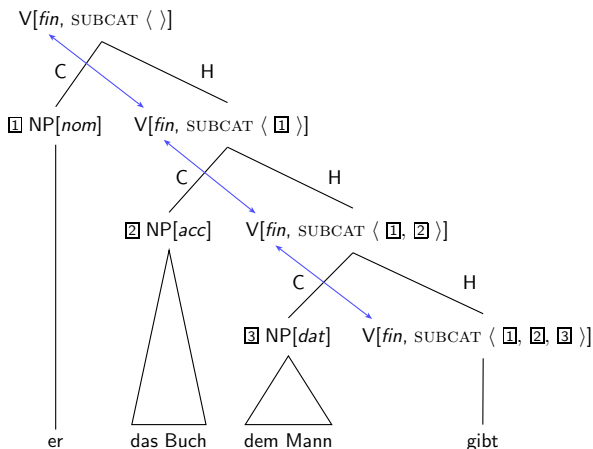

- There is exactly one head daughter (HEAD-DTR).
The head daughter contains the head.
Structure with the daughters *the* and *picture of Mary* → *picture of Mary* is the head daughter, since *picture* is the head.
- There can be more than one non-head daughter (if we assume flat structures or binary branching structures without head).

An Example

Projection of Head Features

The head is the finite verb.

Feature Representation: the HEAD Value

- possible feature geometry:

PHON	<i>list of phonemes</i>
P-O-S	<i>p-o-s</i>
VFORM	<i>vform</i>
SUBCAT	<i>list</i>

Feature Representation: the HEAD Value

- possible feature geometry:

PHON	<i>list of phonemes</i>
P-O-S	<i>p-o-s</i>
VFORM	<i>vform</i>
SUBCAT	<i>list</i>

- more structure, grouping of information that is projected:

PHON	<i>list of phonemes</i>				
HEAD	<table style="border-collapse: collapse;"> <tr> <td style="border-right: 1px solid black; padding: 5px;">P-O-S</td> <td style="padding: 5px;"><i>p-o-s</i></td> </tr> <tr> <td style="border-right: 1px solid black; padding: 5px;">VFORM</td> <td style="padding: 5px;"><i>vform</i></td> </tr> </table>	P-O-S	<i>p-o-s</i>	VFORM	<i>vform</i>
P-O-S	<i>p-o-s</i>				
VFORM	<i>vform</i>				
SUBCAT	<i>list</i>				

Different Heads Project Different Features

- VFORM makes sense for verbs only
- prenominal adjectives and nouns project case (in German)
- possible structure: a structure with all features:

P-O-S	<i>p-o-s</i>
VFORM	<i>vform</i>
CASE	<i>case</i>

CASE would not have a value for verbs, VFORM would not have a value for nouns.

Different Heads Project Different Features

- VFORM makes sense for verbs only
- prenominal adjectives and nouns project case (in German)
- possible structure: a structure with all features:

$$\begin{bmatrix} \text{P-O-S} & p-o-s \\ \text{VFORM} & vform \\ \text{CASE} & case \end{bmatrix}$$

CASE would not have a value for verbs, VFORM would not have a value for nouns.

- Better: different types of feature structures

- the description for verbs:

$$\begin{bmatrix} \text{VFORM} & vform \\ verb \end{bmatrix}$$

- for nouns

$$\begin{bmatrix} \text{CASE} & case \\ noun \end{bmatrix}$$

A Lexical Item with Head Features

- A lexical item consists of:
gibt ('gives'):

A Lexical Item with Head Features

- A lexical item consists of:

gibt ('gives'):

[PHON ⟨ *gibt* ⟩]

- phonological information

A Lexical Item with Head Features

- A lexical item consists of:

gibt ('gives'):

PHON	⟨ <i>gibt</i> ⟩				
HEAD	<table style="border-collapse: collapse;"> <tr> <td style="border-right: 1px solid black; padding-right: 10px; vertical-align: middle;">VFORM</td> <td style="padding-left: 10px; vertical-align: middle;"><i>fin</i></td> </tr> <tr> <td style="border-right: 1px solid black; padding-right: 10px; vertical-align: middle;"></td> <td style="padding-left: 10px; vertical-align: middle;"><i>verb</i></td> </tr> </table>	VFORM	<i>fin</i>		<i>verb</i>
VFORM	<i>fin</i>				
	<i>verb</i>				

- phonological information
- head information (part of speech, verb form, ...)

A Lexical Item with Head Features

- A lexical item consists of:

gibt ('gives'):

$$\left[\begin{array}{l} \text{PHON} \quad \langle \textit{gibt} \rangle \\ \text{HEAD} \quad \left[\begin{array}{l} \text{VFORM} \textit{fin} \\ \textit{verb} \end{array} \right] \\ \text{SUBCAT} \quad \langle \text{NP}[\textit{nom}], \text{NP}[\textit{acc}], \text{NP}[\textit{dat}] \rangle \end{array} \right]$$

- phonological information
- head information (part of speech, verb form, ...)
- valence information: a list of feature descriptions

Head Feature Principle

- In a headed structure the head features of the mother are taken identical with the head features of the head daughter.

$$\textit{headed-structure} \rightarrow \left[\begin{array}{l} \text{HEAD } \boxed{1} \\ \text{HEAD-DTR} | \text{HEAD } \boxed{1} \end{array} \right]$$

Head Feature Principle

- In a headed structure the head features of the mother are token identical with the head features of the head daughter.

$$\textit{headed-structure} \rightarrow \left[\begin{array}{l} \text{HEAD } \boxed{1} \\ \text{HEAD-DTR} | \text{HEAD } \boxed{1} \end{array} \right]$$

- *head-argument-structure* is a subtype of *headed-structure*
 → restrictions hold for this type as well

Head Feature Principle

- In a headed structure the head features of the mother are token identical with the head features of the head daughter.

$$\textit{headed-structure} \rightarrow \left[\begin{array}{l} \text{HEAD } \boxed{1} \\ \text{HEAD-DTR} | \text{HEAD } \boxed{1} \end{array} \right]$$

- *head-argument-structure* is a subtype of *headed-structure*
→ restrictions hold for this type as well
- *head-argument-structure* inherits properties from *headed-structure*.

Integration of Semantics

- sign-based: Syntax and semantics are represented in the same structure (see also Jackendoff, 2011)

Integration of Semantics

- sign-based: Syntax and semantics are represented in the same structure (see also Jackendoff, 2011)
- possible data structure (CONT = CONTENT):

PHON	<i>list of phoneme strings</i>
HEAD	<i>head</i>
SUBCAT	<i>list</i>
CONT	<i>cont</i>

Separate Representation of Syntactic and Semantic Information

- grouping of information, division in syntactic and semantic information

(CAT = CATEGORY)

PHON	<i>list of phoneme strings</i>						
CAT	<table style="border-collapse: collapse;"> <tr> <td style="border-right: 1px solid black; padding: 5px;">HEAD</td> <td style="padding: 5px;"><i>head</i></td> </tr> <tr> <td style="border-right: 1px solid black; padding: 5px;">SUBCAT</td> <td style="padding: 5px;"><i>list</i></td> </tr> <tr> <td style="border-right: 1px solid black; padding: 5px;"></td> <td style="padding: 5px;"><i>cat</i></td> </tr> </table>	HEAD	<i>head</i>	SUBCAT	<i>list</i>		<i>cat</i>
HEAD	<i>head</i>						
SUBCAT	<i>list</i>						
	<i>cat</i>						
CONT	<i>cont</i>						

- possible to share syntactic information only
- symmetric coordination: the CAT value is identical:

- (3) a. [the man and the woman]
 b. He [knows and loves] this record.

.. . [. . .]

German Clause Structure

- Example German: V2 + SOV + free ordering of arguments in the so-called *Mittelfeld*

Deutsch ist eine V/2-Sprache mit Verbendstellung und freier Wortfolge
(Haftka, 1996)

German Clause Structure

- Example German: V2 + SOV + free ordering of arguments in the so-called *Mittelfeld*

Deutsch ist eine V/2-Sprache mit Verbendstellung und freier Wortfolge
(Haftka, 1996)

- almost free order of arguments in the *Mittelfeld*:

- (4) a. weil **der Mann** **der Frau** **das Buch** gibt
 since the man the woman the book gives
 'since the man gives the woman the book'
- b. weil **der Mann** **das Buch** **der Frau** gibt
- c. weil **das Buch** **der Mann** **der Frau** gibt
- d. weil **das Buch** **der Frau** **der Mann** gibt
- e. weil **der Frau** **der Mann** **das Buch** gibt
- f. weil **der Frau** **das Buch** **der Mann** gibt

Adjuncts in the Mittelfeld

- Apart from arguments adjuncts can appear in the Mittelfeld.

Adjuncts in the Mittelfeld

- Apart from arguments adjuncts can appear in the Mittelfeld.
- These can be placed anywhere:
 - (5) a. weil **morgen** der Mann das Buch der Frau gibt
since tomorrow the man the book the woman gives
 - b. weil der Mann **morgen** das Buch der Frau gibt
 - c. weil der Mann das Buch **morgen** der Frau gibt
 - d. weil der Mann das Buch der Frau **morgen** gibt

Scopal Adjuncts

- Scopal adjuncts cannot be reordered without a change in meaning:

- (6) a. weil er absichtlich nicht lacht
since he deliberately not laughs
'since he does not laugh deliberately'
- b. weil er nicht absichtlich lacht
since he not deliberately laughs
'since he does deliberately not laugh'

Proposals

- Various proposals, for a discussion see Müller, 2004, 2005a

Proposals

- Various proposals, for a discussion see Müller, 2004, 2005a
- totally flat structures: verbs and arguments are in the same local tree. (Uszkoreit, 1987; Pollard, 1996)
 - Question: What about adjuncts? Semantics? (Kasper, 1994)
 - What about apparently multiple frontings? (Müller, 2003)

Binary Branching Structures

- Sentences like (7) are no problem:

(7) weil [der Mann [das Buch [der Frau gibt]]]

Binary Branching Structures

- Sentences like (7) are no problem:

(7) weil [der Mann [das Buch [der Frau gibt]]]

- The integration of adjuncts is straight-forward:

(8) a. weil [**morgen** [der Mann [das Buch [der Frau gibt]]]]

b. weil [der Mann [**morgen** [das Buch [der Frau gibt]]]]

c. weil [der Mann [das Buch [**morgen** [der Frau gibt]]]]

d. weil [der Mann [das Buch [der Frau [**morgen** gibt]]]]

Binary Branching Structures

- Sentences like (7) are no problem:

(7) weil [der Mann [das Buch [der Frau gibt]]]

- The integration of adjuncts is straight-forward:

(8) a. weil [morgen [der Mann [das Buch [der Frau gibt]]]]

b. weil [der Mann [morgen [das Buch [der Frau gibt]]]]

c. weil [der Mann [das Buch [morgen [der Frau gibt]]]]

d. weil [der Mann [das Buch [der Frau [morgen gibt]]]]

- The meaning difference in (9) follows from the difference in embedding.

(9) a. weil er [absichtlich [nicht lacht]]

b. weil er [nicht [absichtlich lacht]]

Reordering and Binary Branching

- Analyses with binary branching:
 - Analysis 1: Verb takes the arguments in the order they are represented in the valence list → we need several lexical items to cover all possible orders (Uszkoreit, 1986; Jacobs, 1986)

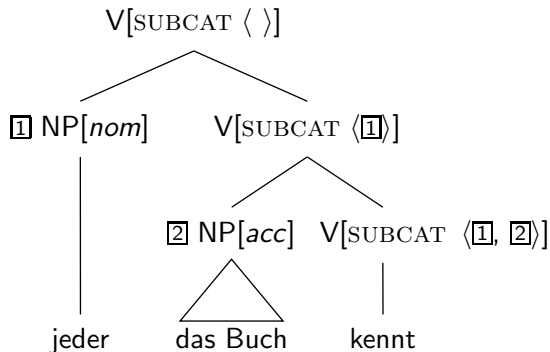

Reordering and Binary Branching

- Analyses with binary branching:
 - Analysis 1: Verb takes the arguments in the order they are represented in the valence list → we need several lexical items to cover all possible orders (Uszkoreit, 1986; Jacobs, 1986)
 - Analysis 2: Verb takes an arbitrary element from the valence list. This proposal can be found in HPSG (Gunji, 1986; Müller, 2008), Categorical Grammar (Hoffman, 1995; Steedman and Baldrige, 2006) and in GB/Minimalism (Fanselow, 2001)

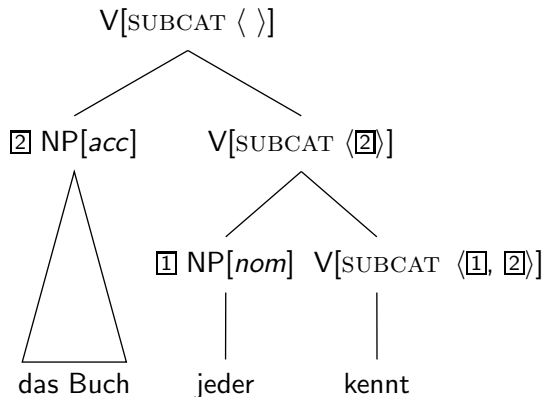

Example: Normal Order

- (10) a. weil jeder das Buch kennt
 b. weil das Buch jeder kennt

Example: Reordering

The difference is the binding off of elements in SUBCAT

Verb Position: “Movement”

- A trace takes the position of the verb in the canonical SOV order.

Verb Position: “Movement”

- A trace takes the position of the verb in the canonical SOV order.
- A special form of the verb is placed in initial position.
This special verb selects a projection of the trace.

Verb Position: “Movement”

- A trace takes the position of the verb in the canonical SOV order.
- A special form of the verb is placed in initial position.
This special verb selects a projection of the trace.
- This special verb is licensed by a unary rule.

Verb Position: “Movement”

- A trace takes the position of the verb in the canonical SOV order.
- A special form of the verb is placed in initial position. This special verb selects a projection of the trace.
- This special verb is licensed by a unary rule.
- Connection between verb and trace via percolation of information.

The LOCAL feature

- Syntactic information (valence, part of speech, inflexion) and semantic information is shared

The LOCAL feature

- Syntactic information (valence, part of speech, inflexion) and semantic information is shared
- This information, which is relevant locally, is grouped under LOCAL.

gibt:

Fronting (V2) as Nonlocal Dependency

- V2 just an alternative linearization?
Nunberg, Sag and Wasow (1994) (for the fronting of idiom parts)
Kathol (1995, Chapter 6.3) for simple frontings

Fronting (V2) as Nonlocal Dependency

- V2 just an alternative linearization?
Nunberg, Sag and Wasow (1994) (for the fronting of idiom parts)
Kathol (1995, Chapter 6.3) for simple frontings
- does not cover all cases:
(11) a. [Um zwei Millionen Mark]_i soll er versucht haben,
[eine Versicherung _{-i} zu betrügen].¹

¹taz, 04.05.2001, p. 20.

Fronting (V2) as Nonlocal Dependency

- V2 just an alternative linearization?
Nunberg, Sag and Wasow (1994) (for the fronting of idiom parts)
Kathol (1995, Chapter 6.3) for simple frontings
- does not cover all cases:
 - (11) a. [Um zwei Millionen Mark]_i soll er versucht haben,
[eine Versicherung _{-i} zu betrügen].¹
 - b. „Wer_i, glaubt er, daß er _{-i} ist?“ erregte sich ein Politiker vom Nil.²

¹taz, 04.05.2001, p. 20.

²Spiegel, 8/1999, p. 18.

Fronting (V2) as Nonlocal Dependency

- V2 just an alternative linearization?
Nunberg, Sag and Wasow (1994) (for the fronting of idiom parts)
Kathol (1995, Chapter 6.3) for simple frontings
- does not cover all cases:
 - (11) a. [Um zwei Millionen Mark]_i soll er versucht haben,
[eine Versicherung _{-i} zu betrügen].¹
 - b. „Wer_i, glaubt er, daß er _{-i} ist?“ erregte sich ein Politiker vom Nil.²
 - c. Wen_i glaubst du, daß ich _{-i} gesehen habe.³

¹taz, 04.05.2001, p. 20.

²Spiegel, 8/1999, p. 18.

³Schernenisse. 1986. n. 84.

Constituent Movement

- As in the example of head movement: Trace at “canonical” position

Constituent Movement

- As in the example of head movement: Trace at “canonical” position

Constituent Movement

- As in the example of head movement: Trace at “canonical” position
- percolation of information in the tree

Constituent Movement

- As in the example of head movement: Trace at “canonical” position
- percolation of information in the tree

Constituent Movement

- As in the example of head movement: Trace at “canonical” position
- percolation of information in the tree
- constituent movement is not local, verb movement is two different features for modelling (SLASH vs. DSL)

The NONLOCAL Feature

- NONLOC contains features that are relevant for nonlocal dependencies (V2, relative clauses, interrogatives, extraposition).

The NONLOCAL Feature

- NONLOC contains features that are relevant for nonlocal dependencies (V2, relative clauses, interrogatives, extraposition).
- description for *kennt jeder* ('knows everybody'):
sentence with missing accusative object:

$$\left[\begin{array}{l} \text{LOC} \mid \text{CAT} \left[\begin{array}{l} \text{HEAD} \left[\begin{array}{l} \text{VFORM } \textit{fin} \\ \textit{verb} \end{array} \right] \\ \text{SUBCAT } \langle \rangle \end{array} \right] \\ \text{NONLOC} \mid \dots \mid \text{SLASH } \langle \text{NP}[\textit{acc}] \rangle \end{array} \right]$$

The NONLOCAL Feature

- NONLOC contains features that are relevant for nonlocal dependencies (V2, relative clauses, interrogatives, extraposition).
- description for *kennt jeder* ('knows everybody'):
sentence with missing accusative object:

$$\left[\begin{array}{l} \text{LOC} \mid \text{CAT} \left[\begin{array}{l} \text{HEAD} \left[\begin{array}{l} \text{VFORM } \textit{fin} \\ \textit{verb} \end{array} \right] \\ \text{SUBCAT} \langle \rangle \end{array} \right] \\ \text{NONLOC} \mid \dots \mid \text{SLASH} \langle \text{NP}[\textit{acc}] \rangle \end{array} \right]$$

- These properties can be selected (LOC and NONLOC).
No selection of daughters.
New feature SYNSEM that includes LOC and NONLOC but excludes HEAD-DTR etc.

Categorical Grammar

- Categorical Grammar is the ancestor of many theories of relevance today (Ajdukiewicz, 1935; Steedman, 2000).

Categorical Grammar

- Categorical Grammar is the ancestor of many theories of relevance today (Ajdukiewicz, 1935; Steedman, 2000).
 - Binary branching functor argument structures.
(some HPSG grammars use flat structures)

Categorical Grammar

- Categorical Grammar is the ancestor of many theories of relevance today (Ajdukiewicz, 1935; Steedman, 2000).
 - Binary branching functor argument structures.
(some HPSG grammars use flat structures)
 - Argument composition for predicate complexes (Geach, 1970).

Categorical Grammar

- Categorical Grammar is the ancestor of many theories of relevance today (Ajdukiewicz, 1935; Steedman, 2000).
 - Binary branching functor argument structures.
(some HPSG grammars use flat structures)
 - Argument composition for predicate complexes (Geach, 1970).
- CG has problems with relative clauses and pied piping (Pollard, 1988).

Categorical Grammar

- Categorical Grammar is the ancestor of many theories of relevance today (Ajdukiewicz, 1935; Steedman, 2000).
 - Binary branching functor argument structures.
(some HPSG grammars use flat structures)
 - Argument composition for predicate complexes (Geach, 1970).
- CG has problems with relative clauses and pied piping (Pollard, 1988).
- Solution: Explicit passing around of features related to relative pronouns
→ HPSG.

Categorical Grammar

- Categorical Grammar is the ancestor of many theories of relevance today (Ajdukiewicz, 1935; Steedman, 2000).
 - Binary branching functor argument structures.
(some HPSG grammars use flat structures)
 - Argument composition for predicate complexes (Geach, 1970).
- CG has problems with relative clauses and pied piping (Pollard, 1988).
- Solution: Explicit passing around of features related to relative pronouns
→ HPSG.
- Additional rules are needed in CG,
some are already there (topicalization).

Categorial Grammar

- Categorial Grammar is the ancestor of many theories of relevance today (Ajdukiewicz, 1935; Steedman, 2000).
 - Binary branching functor argument structures.
(some HPSG grammars use flat structures)
 - Argument composition for predicate complexes (Geach, 1970).
- CG has problems with relative clauses and pied piping (Pollard, 1988).
- Solution: Explicit passing around of features related to relative pronouns
→ HPSG.
- Additional rules are needed in CG,
some are already there (topicalization).
- It does not make sense for all structures to assume a head (functor).
See for instance Constructionist work by Jackendoff (2008) and Jacobs (2008).

LFG's f-structure and HPSG's projected Argument Structure

- Wambaya: The traditional NP can be realized discontinuously. Adjectives and nouns agree in case.

LFG's f-structure and HPSG's projected Argument Structure

- Wambaya: The traditional NP can be realized discontinuously. Adjectives and nouns agree in case.
- Nordlinger (1998) suggested LFG analysis in which constituents refer to the f-structure for the enforcement of agreement.

LFG's f-structure and HPSG's projected Argument Structure

- Wambaya: The traditional NP can be realized discontinuously. Adjectives and nouns agree in case.
- Nordlinger (1998) suggested LFG analysis in which constituents refer to the f-structure for the enforcement of agreement.
- Bender (2008): This can be modeled in HPSG if a non-cancellation approach to valence is assumed.

LFG's f-structure and HPSG's projected Argument Structure

- Wambaya: The traditional NP can be realized discontinuously. Adjectives and nouns agree in case.
- Nordlinger (1998) suggested LFG analysis in which constituents refer to the f-structure for the enforcement of agreement.
- Bender (2008): This can be modeled in HPSG if a non-cancellation approach to valence is assumed.
- Non-cancellation was first suggested in GB: Higginbotham (1985, p. 560).

LFG's f-structure and HPSG's projected Argument Structure

- Wambaya: The traditional NP can be realized discontinuously. Adjectives and nouns agree in case.
- Nordlinger (1998) suggested LFG analysis in which constituents refer to the f-structure for the enforcement of agreement.
- Bender (2008): This can be modeled in HPSG if a non-cancellation approach to valence is assumed.
- Non-cancellation was first suggested in GB: Higginbotham (1985, p. 560).
- Introduced and motivated for HPSG:
Meurers, 1999, Przepiórkowski, 1999, Müller, 2008, Chapter 17.4

Minimalism

- Minimalist Program: There is only Move and Merge.

Minimalism

- Minimalist Program: There is only Move and Merge.
- The Head Complement Schema of HPSG is Merge.

Minimalism

- Minimalist Program: There is only Move and Merge.
- The Head Complement Schema of HPSG is Merge.
- The Filler Head Schema of HPSG is Move. (see Müller, Submitted)

Minimalism

- Minimalist Program: There is only Move and Merge.
- The Head Complement Schema of HPSG is Merge.
- The Filler Head Schema of HPSG is Move. (see Müller, Submitted)
- So, is everything the same?

Minimalism vs. Constraint-Based Theories

- Yes and no. Look at the trees!
HPSG is minimalist in terms of tree structure.

Minimalism vs. Constraint-Based Theories

- Yes and no. Look at the trees!
HPSG is minimalist in terms of tree structure.
- Empty elements are avoided.
(They have to be justifiable on a language particular basis)

Minimalism vs. Constraint-Based Theories

- Yes and no. Look at the trees!
HPSG is minimalist in terms of tree structure.
- Empty elements are avoided.
(They have to be justifiable on a language particular basis)
- HPSG is model theoretic, declarative, constraint-based.

Minimalism vs. Constraint-Based Theories

- Yes and no. Look at the trees!
HPSG is minimalist in terms of tree structure.
- Empty elements are avoided.
(They have to be justifiable on a language particular basis)
- HPSG is model theoretic, declarative, constraint-based.
- Minimalism is generative-enumerative and derivational rather than representational. (Pullum and Scholz, 2001)

Mixing up Levels (some variants)

- MGG is syntax centered:
A strong syntactic component and then interface modules PF and LF.

Mixing up Levels (some variants)

- MGG is syntax centered:
A strong syntactic component and then interface modules PF and LF.
- As a result a lot of semantic or information structure phenomena are now treated in syntax with invisible functional projections:
 - SpeakerP, HearerP (Poletto, 2000, p. 31)
 - TopP, ForceP, OuterTopP (Rizzi, 1997; Grewendorf, 2002, 2009; Wiklund et al., 2007)
 - Quality, Size, Shape, Color, Nationality (Cinque, 1994, p. 96, 99)
- Other stuff that does not correspond to traditional, part of speech-based categories:
 - SubjP, ObjP, TraP (Transitive Phrase), IntraP (Intransitive Phrase) (Karimi-Doostan, 2005)

Core and the Rest

- Most work in GB/Minimalism is on the so-called Core, that is, the regular and common parts of language.

Core and the Rest

- Most work in GB/Minimalism is on the so-called Core, that is, the regular and common parts of language.
- Other areas exist and the ultimate value of a theory depends on its capability to cover both core and periphery.

Evidence from a single language and UG

- What does it mean for other languages that a rule/morpheme is present in one particular language?

Evidence from a single language and UG

- What does it mean for other languages that a rule/morpheme is present in one particular language?
- Possible answer:
If we have a certain structure in language X, it must be present in all languages.

Evidence from a single language and UG

- What does it mean for other languages that a rule/morpheme is present in one particular language?
- Possible answer:
If we have a certain structure in language X, it must be present in all languages.
- Example:
 - Basque: Tree positions for object agreement (AgrO, AgrIO)
 - Japanese: Tree position for topic marker

Evidence from a single language and UG

- What does it mean for other languages that a rule/morpheme is present in one particular language?
- Possible answer:
If we have a certain structure in language X, it must be present in all languages.
- Example:
 - Basque: Tree positions for object agreement (AgrO, AgrIO)
 - Japanese: Tree position for topic marker
- German and Dutch neither have object agreement nor topic morphemes.

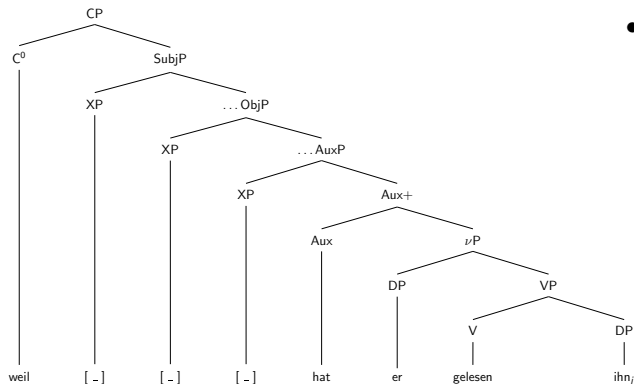

Evidence from a single language and UG

- What does it mean for other languages that a rule/morpheme is present in one particular language?
- Possible answer:
If we have a certain structure in language X, it must be present in all languages.
- Example:
 - Basque: Tree positions for object agreement (AgrO, AgrIO)
 - Japanese: Tree position for topic marker
- German and Dutch neither have object agreement nor topic morphemes.
- Conclusion:
If such inferences regarding properties of particular languages, one has to assume (very specific!) innate linguistic knowledge.

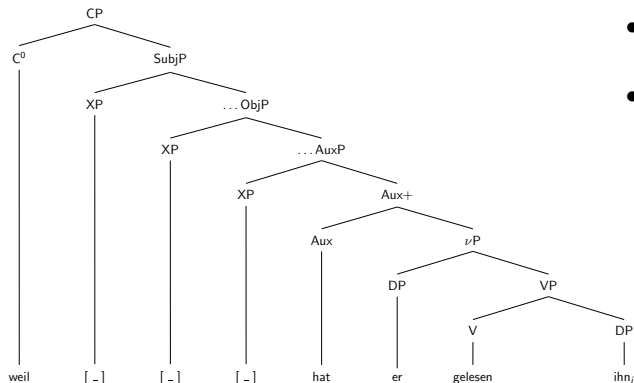

German is English/Romance (SVO, Laenzlinger following Kayne)

- All languages are SVO underlyingly.

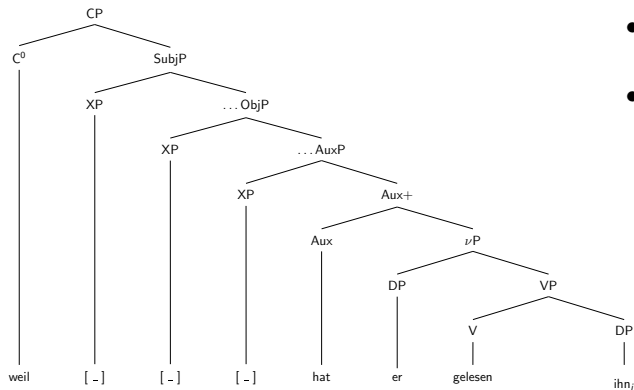

German is English/Romance (SVO, Laenzlinger following Kayne)

- All languages are SVO underlyingly.
- The object is moved out of the VP.

- Hornstein, Nunes and Grohmann (2005, p. 124): agreement head for the checking of case features
- Preposition is moved there.
- DP is put into the specifier position of this head.
- Evidence for this:
Agreement in Hungarian postpositional phrases
- English is like Hungarian,
but the movement is invisible.

German is German, . . . Hungarian is Hungarian

- A PP is a P together with an NP (or DP).

German is German, . . . Hungarian is Hungarian

- A PP is a P together with an NP (or DP).
- No movement instead of two movements.

German is German, . . . Hungarian is Hungarian

- A PP is a P together with an NP (or DP).
- No movement instead of two movements.
- Structure has five nodes less.

German is German, . . . Hungarian is Hungarian

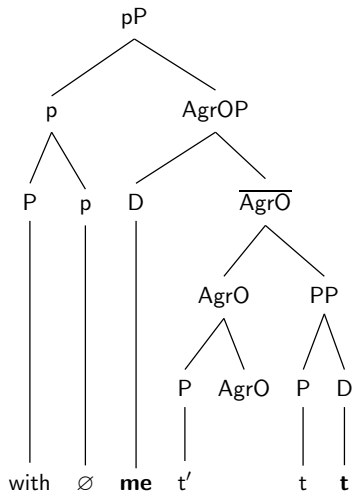

- A PP is a P together with an NP (or DP).
- No movement instead of two movements.
- Structure has five nodes less.
- Truly minimal!

German is German, . . . Hungarian is Hungarian

- A PP is a P together with an NP (or DP).
- No movement instead of two movements.
- Structure has five nodes less.
- Truly minimal!
- Question: What constitutes an explanation?
Where and how is complexity of language represented?

The Swiss Cheese

- from another text book:
Radford (1997, p. 452)
- Sternefeld (2006, p. 549–550) calls this a Swiss Cheese analysis, but there are more holes (5) than cheese (2).

Sociological Differences

- The way arguments work (sometimes) differs dramatically.
(See Culicover and Jackendoff, 2005 on uniformity)

Sociological Differences

- The way arguments work (sometimes) differs dramatically.
(See Culicover and Jackendoff, 2005 on uniformity)
- Avoid empty elements!
This should be a strategy for every linguistic theory (Occam's Razor)!

Minimalism and Psycholinguistic Plausibility

- Derivations are psycholinguistically implausible.
Derivational Theory of Complexity (DTC) falsified in the 70s
(Fodor, Bever and Garrett, 1974, p. 320–328).

Minimalism and Psycholinguistic Plausibility

- Derivations are psycholinguistically implausible.
Derivational Theory of Complexity (DTC) falsified in the 70s (Fodor, Bever and Garrett, 1974, p. 320–328).
- See Wittenberg et al. (To appear) on the plausibility of recent head-movement analyses.

Minimalism and Psycholinguistic Plausibility

- Derivations are psycholinguistically implausible.
Derivational Theory of Complexity (DTC) falsified in the 70s (Fodor, Bever and Garrett, 1974, p. 320–328).
- See Wittenberg et al. (To appear) on the plausibility of recent head-movement analyses.
- See Sag and Wasow (2011); Jackendoff (2011) on psycholinguistically plausible theories and Labelle, 2007 for a brief note on Phases.

Minimalism and Psycholinguistic Plausibility

- Derivations are psycholinguistically implausible.
Derivational Theory of Complexity (DTC) falsified in the 70s (Fodor, Bever and Garrett, 1974, p. 320–328).
- See Wittenberg et al. (To appear) on the plausibility of recent head-movement analyses.
- See Sag and Wasow (2011); Jackendoff (2011) on psycholinguistically plausible theories and Labelle, 2007 for a brief note on Phases.
- Processing is incremental and takes all levels (phonology, syntax, semantics, world knowledge) into account (Tanenhaus et al., 1996).

Minimalism and Psycholinguistic Plausibility

- Derivations are psycholinguistically implausible.
Derivational Theory of Complexity (DTC) falsified in the 70s (Fodor, Bever and Garrett, 1974, p. 320–328).
- See Wittenberg et al. (To appear) on the plausibility of recent head-movement analyses.
- See Sag and Wasow (2011); Jackendoff (2011) on psycholinguistically plausible theories and Labelle, 2007 for a brief note on Phases.
- Processing is incremental and takes all levels (phonology, syntax, semantics, world knowledge) into account (Tanenhaus et al., 1996).
- Realistic theories have to be:
 - surface-oriented
 - constraint-based

Minimalism and Psycholinguistic Plausibility

- Derivations are psycholinguistically implausible.
Derivational Theory of Complexity (DTC) falsified in the 70s (Fodor, Bever and Garrett, 1974, p. 320–328).

- Processing is incremental and takes all levels (phonology, syntax, semantics, world knowledge) into account (Tanenhaus et al., 1996).
- Realistic theories have to be:
 - surface-oriented
 - constraint-based
- See Pulvermüller (2003) on how this could be implemented in the brain.

Construction Grammar

- CxG (Goldberg, 1995, 2006; Tomasello, 2003) is sign-based (as is HPSG)

Construction Grammar

- CxG (Goldberg, 1995, 2006; Tomasello, 2003) is sign-based (as is HPSG)
- There is continued discussion about the issue whether constructions should be lexical or phrasal: Müller, 2006, two special issues of journals, . . . , Müller and Wechsler, 2012

Construction Grammar

- CxG (Goldberg, 1995, 2006; Tomasello, 2003) is sign-based (as is HPSG)
- There is continued discussion about the issue whether constructions should be lexical or phrasal: Müller, 2006, two special issues of journals, . . . , Müller and Wechsler, 2012
- Most authors in HPSG assume lexical constructions, whereas most CxG authors assume phrasal ones.

Construction Grammar

- CxG (Goldberg, 1995, 2006; Tomasello, 2003) is sign-based (as is HPSG)
- There is continued discussion about the issue whether constructions should be lexical or phrasal: Müller, 2006, two special issues of journals, . . . , Müller and Wechsler, 2012
- Most authors in HPSG assume lexical constructions, whereas most CxG authors assume phrasal ones.
- Goldberg (2013):
Lexical rules understood as templates are compatible with her views.

Construction Grammar

- CxG (Goldberg, 1995, 2006; Tomasello, 2003) is sign-based (as is HPSG)
- There is continued discussion about the issue whether constructions should be lexical or phrasal: Müller, 2006, two special issues of journals, . . . , Müller and Wechsler, 2012
- Most authors in HPSG assume lexical constructions, whereas most CxG authors assume phrasal ones.
- Goldberg (2013):
Lexical rules understood as templates are compatible with her views.
- This view of lexical rules is adopted in HPSG (Meurers, 2001).

Construction Grammar

- CxG (Goldberg, 1995, 2006; Tomasello, 2003) is sign-based (as is HPSG)
- There is continued discussion about the issue whether constructions should be lexical or phrasal: Müller, 2006, two special issues of journals, . . . , Müller and Wechsler, 2012
- Most authors in HPSG assume lexical constructions, whereas most CxG authors assume phrasal ones.
- Goldberg (2013):
Lexical rules understood as templates are compatible with her views.
- This view of lexical rules is adopted in HPSG (Meurers, 2001).
- HPSG (Sag, 1997) can be seen as a formalized variant of CxG.

Summary

- We successfully (?) covered everything that is normally covered in one semester.

Summary

- We successfully (?) covered everything that is normally covered in one semester.
- Features, values and identity

Summary

- We successfully (?) covered everything that is normally covered in one semester.
- Features, values and identity
- HPSG structures are complex since certain features are shared simultaneously.
Nowadays most theories assume features but often they are not grouped.

Poverty of the Stimulus and U-DOP

- U-DOP learns from examples that do not contain examples with auxiliary inversion and relative clauses (Bod, 2009).
Once one learned the correct trees for (12) one can also assign the correct structure to sentences with auxiliary inversion (p. 778):

- (12) a. The man who is eating is hungry.
b. Is the boy hungry?

Poverty of the Stimulus and U-DOP

- U-DOP learns from examples that do not contain examples with auxiliary inversion and relative clauses (Bod, 2009).
Once one learned the correct trees for (12) one can also assign the correct structure to sentences with auxiliary inversion (p. 778):

- (12) a. The man who is eating is hungry.
b. Is the boy hungry?

To acquire (12) for example the sentences in (13) are sufficient:

- (13) a. The man who is eating mumbled.
b. The man is hungry.
c. The man mumbled.
d. The boy is eating.

Poverty of the Stimulus and U-DOP – II

- Procedure:
 1. Compute all possible (binary branching) trees (without category symbols) for a set of given sentences.
 2. Compute all subtrees of these trees.
 3. Compute the best tree for a given sentence.

Poverty of the Stimulus and U-DOP – II

- Procedure:
 1. Compute all possible (binary branching) trees (without category symbols) for a set of given sentences.
 2. Compute all subtrees of these trees.
 3. Compute the best tree for a given sentence.
- The acquired grammars make the same mistakes as children!

Possible binary branching structures for *Watch the dog* and *The dog barks*

Subtrees

- Jeder Baum hat eine Wahrscheinlichkeit von 1/12.

Subtrees

- Jeder Baum hat eine Wahrscheinlichkeit von $1/12$.
- *the dog* kommt zweimal vor!
Wahrscheinlichkeit = $2/12$.

Typen: Ein nicht-linguistisches Beispiel für Mehrfachvererbung

Eigenschaften von Typhierarchien

- Subtypen erben Eigenschaften und Beschränkungen von ihre(n) Supertypen.

Eigenschaften von Typhierarchien

- Subtypen erben Eigenschaften und Beschränkungen von ihre(n) Supertypen.
- Generalisierungen können erfaßt werden: Allgemeine Beschränkungen werden an oberen Typen repräsentiert.

Eigenschaften von Typhierarchien

- Subtypen erben Eigenschaften und Beschränkungen von ihre(n) Supertypen.
- Generalisierungen können erfaßt werden: Allgemeine Beschränkungen werden an oberen Typen repräsentiert.
- Speziellere Typen erben diese Information von ihren Obertypen.

Eigenschaften von Typhierarchien

- Subtypen erben Eigenschaften und Beschränkungen von ihre(n) Supertypen.
- Generalisierungen können erfaßt werden: Allgemeine Beschränkungen werden an oberen Typen repräsentiert.
- Speziellere Typen erben diese Information von ihren Obertypen.
- Dadurch Repräsentation von Information ohne Redundanz möglich

Linguistische Generalisierungen im Typsystem

- Typen bilden Hierarchie

Linguistische Generalisierungen im Typsystem

- Typen bilden Hierarchie
- oben steht der allgemeinste Typ

Linguistische Generalisierungen im Typsystem

- Typen bilden Hierarchie
- oben steht der allgemeinste Typ
- Information über Eigenschaften von Objekten eines bestimmten Typs werden beim Typ spezifiziert.

Linguistische Generalisierungen im Typsystem

- Typen bilden Hierarchie
- oben steht der allgemeinste Typ
- Information über Eigenschaften von Objekten eines bestimmten Typs werden beim Typ spezifiziert.
- Untertypen ererben diese Eigenschaften

Linguistische Generalisierungen im Typsystem

- Typen bilden Hierarchie
- oben steht der allgemeinste Typ
- Information über Eigenschaften von Objekten eines bestimmten Typs werden beim Typ spezifiziert.
- Untertypen ererben diese Eigenschaften
- Beispiel: Lexikoneintrag in Meyers Lexikon. Verweise auf übergeordnete Konzepte, keine Wiederholung der bereits beim übergeordneten Konzept aufgeführten Information

Linguistische Generalisierungen im Typsystem

- Typen bilden Hierarchie
- oben steht der allgemeinste Typ
- Information über Eigenschaften von Objekten eines bestimmten Typs werden beim Typ spezifiziert.
- Untertypen ererben diese Eigenschaften
- Beispiel: Lexikoneintrag in Meyers Lexikon. Verweise auf übergeordnete Konzepte, keine Wiederholung der bereits beim übergeordneten Konzept aufgeführten Information
- Der obere Teil der Typhierarchie ist für alle Sprachen relevant (Universalgrammatik).

Linguistische Generalisierungen im Typsystem

- Typen bilden Hierarchie
- oben steht der allgemeinste Typ
- Information über Eigenschaften von Objekten eines bestimmten Typs werden beim Typ spezifiziert.
- Untertypen ererben diese Eigenschaften
- Beispiel: Lexikoneintrag in Meyers Lexikon. Verweise auf übergeordnete Konzepte, keine Wiederholung der bereits beim übergeordneten Konzept aufgeführten Information
- Der obere Teil der Typhierarchie ist für alle Sprachen relevant (Universalgrammatik).
- Spezifischere Typen können sprachklassen- oder sprachspezifisch sein.

Typhierarchie für *sign*

alle Untertypen von *headed-structure* erben Beschränkung

Kopf-Komplement-Schema + Kopfmerkmalsprinzip

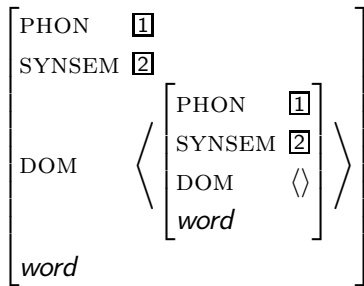

Typ *head-argument-structure* mit von *headed-structure* ererbter Information

Repräsentation lexikalischer Köpfe

- Jeder Kopf enthält in seiner Konstituentenstellungsdomäne eine Beschreibung von sich selbst.

Repräsentation lexikalischer Köpfe

- Jeder Kopf enthält in seiner Konstituentenstellungsdomäne eine Beschreibung von sich selbst.
- Adjunkt- und Komplementtöchter werden in diese Liste eingesetzt und relativ zu ihm angeordnet.

Domänenbildung

- alle Nicht-Kopftöchter werden in die Domäne des Kopfes eingesetzt

head-non-cluster-structure →

- dort können sie frei angeordnet werden, solange LP-Regeln nicht verletzt sind
- Die *shuffle*-Relation besteht zwischen drei Listen A, B und C, gdw. C alle Elemente von A und B enthält und die Reihenfolge der Elemente von A und die Reihenfolge der Elemente in B in C erhalten ist.

$$\begin{aligned} \langle a, b \rangle \circ \langle c, d \rangle = & \langle a, b, c, d \rangle \vee \\ & \langle a, c, b, d \rangle \vee \\ & \langle a, c, d, b \rangle \vee \\ & \langle c, a, b, d \rangle \vee \\ & \langle c, a, d, b \rangle \vee \\ & \langle c, d, a, b \rangle \end{aligned}$$

PHON-Berechnung

- in Domäne entsprechend der Oberflächenreihenfolge angeordnet
- → Berechnung des PHON-Wertes ist einfache Konkatenation

$$\left[\begin{array}{l} \text{PHON } \boxed{1} \oplus \dots \oplus \boxed{n} \\ \text{DOM } \left\langle \left[\begin{array}{l} \text{PHON } \boxed{1} \\ \textit{sign} \end{array} \right], \dots, \left[\begin{array}{l} \text{PHON } \boxed{n} \\ \textit{sign} \end{array} \right] \right\rangle \\ \textit{phrase} \end{array} \right]$$

Alternative: Linearisierungsbasierte HPSG

- Bei binär verzweigenden Strukturen kann man immer nur die beiden Töchter relativ zueinander anordnen.

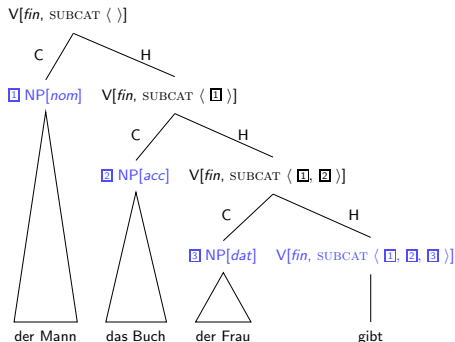

Alternative: Linearisierungsbasierte HPSG

- Bei binär verzweigenden Strukturen kann man immer nur die beiden Töchter relativ zueinander anordnen.
- Erweiterung der Linearisierungsdomänen: Reape (1994), Kathol (1995, 2000); Kathol and Pollard (1995), Müller (1995, 1999, 2002)

Alternative: Linearisierungsbasierte HPSG

- Bei binär verzweigenden Strukturen kann man immer nur die beiden Töchter relativ zueinander anordnen.
- Erweiterung der Linearisierungsdomänen: Reape (1994), Kathol (1995, 2000); Kathol and Pollard (1995), Müller (1995, 1999, 2002)
- Kathol: Linearisierungsdomänen + Topologische Felder, Kopplung an Satztypen

Linearisierungsdomänen und diskontinuierliche Konstituenten

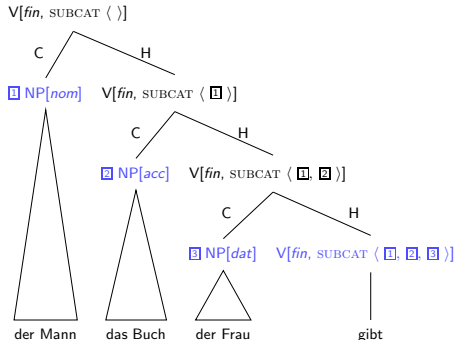

- blaue Knoten werden in eine Liste eingefügt: die Linearisierungsdomäne

Linearisierungsdomänen und diskontinuierliche Konstituenten

- blaue Knoten werden in eine Liste eingefügt: die Linearisierungsdomäne
- die Permutation von Elementen in solchen Domänen ist nur durch Linearisierungsregeln beschränkt

Linearisierungsdomänen und diskontinuierliche Konstituenten

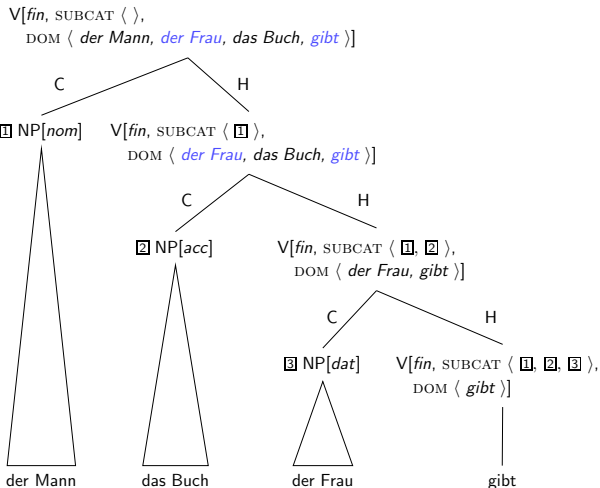

- blaue Knoten werden in eine Liste eingefügt: die Linearisierungsdomäne
- die Permutation von Elementen in solchen Domänen ist nur durch Linearisierungsregeln beschränkt
- Linearisierungsdomänen sind Kopfdomänen \leftrightarrow *Scrambling* ist lokal

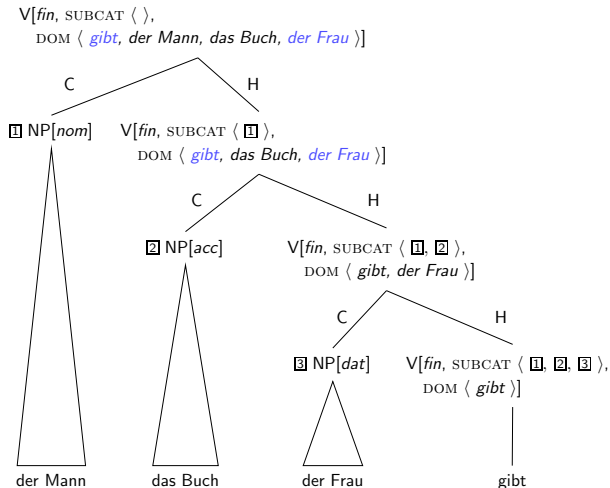

Beispiel: Kontinuierliche Konstituenten

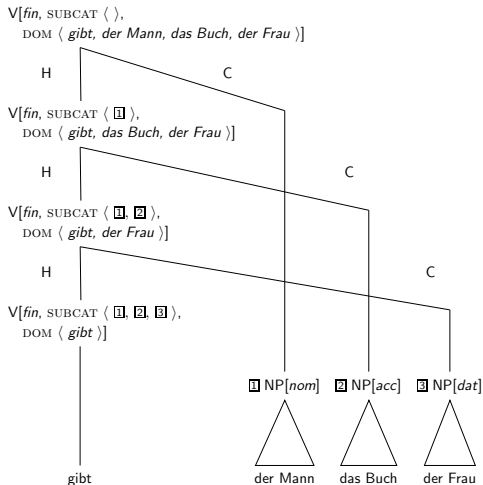

Beispiel: Diskontinuierliche Konstituenten / Anordnung im Mittelfeld

Beispiel: Diskontinuierliche Konstituenten / Verberststellung

Verbstellung mit den Konstituenten in Oberflächenreihenfolge

Eine Anmerkung

- die Dominanzstrukturen für die Sätze in (14) sind identisch:
(14) a. der Mann der Frau das Buch gibt.
b. der Mann das Buch der Frau gibt.
c. Gibt der Mann das Buch der Frau.
- Nur die Anordnung der Elemente in den Stellungsdomänen ist anders.

Probleme der Linearisierungsansätze: Teilprojektionen im VF

- Man kann nicht ohne weiteres erklären, wieso sowohl Dativobjekte als auch Akkusativobjekte mit dem Verb im Vorfeld stehen können.
(15) a. Den Wählern erzählen sollte man diese Geschichte nicht.
b. Märchen erzählen sollte man den Wählern nicht.

Probleme der Linearisierungsansätze: Teilprojektionen im VF

- Man kann nicht ohne weiteres erklären, wieso sowohl Dativobjekte als auch Akkusativobjekte mit dem Verb im Vorfeld stehen können.
(15) a. Den Wählern erzählen sollte man diese Geschichte nicht.
b. Märchen erzählen sollte man den Wählern nicht.
- In Linearisierungsgrammatiken muß man die Argumente eines Kopfes in einer festen Reihenfolge sättigen, da die Sättigungsreihenfolge von der Oberflächenreihenfolge unabhängig ist.

Probleme der Linearisierungsansätze: Teilprojektionen im VF

- Man kann nicht ohne weiteres erklären, wieso sowohl Dativobjekte als auch Akkusativobjekte mit dem Verb im Vorfeld stehen können.
(15) a. Den Wählern erzählen sollte man diese Geschichte nicht.
b. Märchen erzählen sollte man den Wählern nicht.
- In Linearisierungsgrammatiken muß man die Argumente eines Kopfes in einer festen Reihenfolge sättigen, da die Sättigungsreihenfolge von der Oberflächenreihenfolge unabhängig ist.
- mit SUBCAT list $\langle \text{NP}[\textit{nom}], \text{NP}[\textit{acc}], \text{NP}[\textit{dat}] \rangle$ nur (15a) analysierbar (15b) bleibt unanalysierbar, da *Märchen* erst mit *erzählen* kombiniert werden kann, wenn die Kombination mit dem Dativobjekt erfolgt ist.

Probleme der Linearisierungsansätze: Teilprojektionen im VF

- Man kann nicht ohne weiteres erklären, wieso sowohl Dativobjekte als auch Akkusativobjekte mit dem Verb im Vorfeld stehen können.
 - (15) a. Den Wählern erzählen sollte man diese Geschichte nicht.
 - b. Märchen erzählen sollte man den Wählern nicht.
- In Linearisierungsgrammatiken muß man die Argumente eines Kopfes in einer festen Reihenfolge sättigen, da die Sättigungsreihenfolge von der Oberflächenreihenfolge unabhängig ist.
- mit SUBCAT list $\langle NP[nom], NP[acc], NP[dat] \rangle$ nur (15a) analysierbar (15b) bleibt unanalysierbar, da *Märchen* erst mit *erzählen* kombiniert werden kann, wenn die Kombination mit dem Dativobjekt erfolgt ist.
- Kathol (2000): keine Reihenfolge für Objekte in der SUBCAT list
Damit sind Sätze in (15) analysierbar, aber (16) hätte zwei Analysen:
(16) daß er den Wählern Märchen erzählt

Teilprojektionen im VF

- Für den hier vorgestellten Ansatz sind Sätze in (17) unproblematisch:

- (17) a. Den Wählern erzählen sollte man diese Geschichte nicht.
b. Märchen erzählen sollte man den Wählern nicht.

Das Kopf-Argument-Schema läßt Kombination von Argumenten mit ihrem Kopf in beliebiger Reihenfolge zu.

Scheinbar mehrfache Vorfeldbesetzung

- Es gibt im Deutschen Sätze mit mehreren Konstituenten im Vorfeld (Müller, 2003; Müller, Bildhauer and Cook, 2012):
 - (18) a. [**Zum zweiten Mal**] [**die Weltmeisterschaft**] errang Clark 1965. (Beneš, 1971)
 - b. [**Der Universität**] [**zum Jubiläum**] gratulierte auch Bundesminister Dorothee Wilms, die in den fünfziger Jahren in Köln studiert hatte. (Kölner Universitätsjournal, 1988, S. 36, zitiert nach Dürscheid, 1989, S. 87)
 - c. [**Trocken**] [**durch die Stadt**] kommt man am Wochenende auch mit der BVG. (taz, 10.07.1998, S. 22)

Scheinbar mehrfache Vorfelddbesetzung

- Es gibt im Deutschen Sätze mit mehreren Konstituenten im Vorfeld (Müller, 2003; Müller, Bildhauer and Cook, 2012):
 - (18) a. [**Zum zweiten Mal**] [**die Weltmeisterschaft**] errang Clark 1965. (Beneš, 1971)
 - b. [**Der Universität**] [**zum Jubiläum**] gratulierte auch Bundesminister Dorothee Wilms, die in den fünfziger Jahren in Köln studiert hatte. (Kölner Universitätsjournal, 1988, S. 36, zitiert nach Dürscheid, 1989, S. 87)
 - c. [**Trocken**] [**durch die Stadt**] kommt man am Wochenende auch mit der BVG. (taz, 10.07.1998, S. 22)
- Diese Sätze sind parallel zur Partiellen Voranstellung mit Verb, wenn man über einen leeren Verbkopf verfügt. (Müller, 2005b)

Probleme für alle Analysen ohne leeres Verb

- Man kann nicht motivieren, daß mehrere Konstituenten im Vorfeld eine gemeinsame Konstituente bilden.

Probleme für alle Analysen ohne leeres Verb

- Man kann nicht motivieren, daß mehrere Konstituenten im Vorfeld eine gemeinsame Konstituente bilden.
- Wetta (2011) nimmt an, dass im Vorfeld einfacher Sätze mehrere Konstituenten stehen können, die zusammen als ein Objekt in die übergeordnete Domäne eingesetzt werden. Fernabhängigkeiten analysiert er mit SLASH.

Problem: Scheinbar mehrfache Vorfeldbesetzung kann auch Satzgrenzen kreuzen. Fanselow (1993, p. 67):

- (19) a. Der Maria das Buch wenn du denkst daß du geben darfst bist du schön blöd.
- b. Der Maria einen Ring glaub ich nicht daß er je schenken wird.
